

MPC Data Embedded Linux Group

MPC Data's Embedded Linux Group has a dedicated team of experts who understand the challenges of developing a product from the ground up:

- Feasibility
- Requirements capture
- Hardware selection
- Implementation
- Testing
- Support
- Product realisation

Our experience in Linux and other Unix-like software projects spans two decades and includes hundreds of successful projects. This makes us uniquely qualified to advise on some of the idiosyncrasies associated with building products which use open source components:

- 'Commercial grade' and secure Linux
- IP protection & licensing advice
- Integrating commercial components
- User Interface frameworks
- Real-time capabilities
- Power management
- Boot loaders
- MMU-less and minimal ROM solutions

The Embedded Linux Group has formed alliances with carefully selected companies to complete our service offering. This includes silicon vendors who actively support embedded Linux; software vendors who offer complementary products such as virtualisation, graphical frameworks and real-time extensions and approved distributions; and component vendors who offer hardware reference solutions.

Some of the products powered by MPC Data solutions:

- Smart phones
- PIN Pads
- PMPs
- VoIP handsets
- Base stations
- Sat Nav
- Network devices
- Digital TV
